CookiePilot for PrestaShop

Merchant guide · module version 1.1.0 · PrestaShop 8.0 – 9.x

What the module does

CookiePilot shows a cookie consent banner in your store, holds back analytics and advertising tags until the visitor agrees, keeps a log of every consent decision and sends Google Consent Mode v2 signals. CookiePilot is a hosted service: the module connects your store to a CookiePilot account. A free plan covers one domain and 10,000 pageviews per month.

Requirements

- PrestaShop 8.0 or newer (tested on 9.1).
- Outgoing HTTPS connections from the server to `api.cookiepilot.io`.
- Your store must be reachable at its public domain — the module registers this domain.

Installation

1. In the back office open **Modules › Module Manager** and click **Upload a module** (skip this step if you install from PrestaShop Addons).
2. Choose the ZIP file and wait for the confirmation.
3. Click **Configure** next to **CookiePilot CMP**.

Connecting your store

New account: fill in *Create a free account* (name, organization, email, password), accept the terms and click **Create account**. Open the verification link from the email. You return to the store and the shop is connected automatically.

Existing account: enter your CookiePilot email and password under *Log in to CookiePilot* and click **Log in and connect shop**.

After connecting, the module creates the domain in CookiePilot, stores its key encrypted with your shop's cookie key and enables the banner on the storefront.

> Use your CookiePilot account, not your PrestaShop employee account.

Storefront and Consent Mode

The module adds a small script to the page header that sets Google Consent Mode v2 to *denied* before other tags, then loads the banner from `cdn.cookiepilot.io`. Known tracker tags in the page HTML (Google Analytics, Google Tag Manager, Meta Pixel, Google Ads) are held back until the visitor accepts the matching category. You can switch the banner off at any time with **Enable CookiePilot banner and Consent Mode**.

Banner settings

Setting	What it changes
Position	Top, bottom or centre of the screen.
Layout	Bar, floating box or modal window.
Colours	Primary colour, button text, background and text.
Privacy policy URL	Link shown in the banner.
Floating settings button	Lets visitors reopen the banner and change their decision.

Save and publish banner makes the change live. Texts, languages, categories and the cookie scanner are managed in the CookiePilot dashboard (**Advanced settings**).

Plans and billing

The *Plans and billing* section lists the available plans. Paid plans are bought through Stripe Checkout; invoices and cancellations are handled in the **Billing portal**.

Multistore

The connection is stored per shop. Connect each shop separately; copying a shop does not copy its CookiePilot connection.

Data sent to CookiePilot

- The account details you enter when you register or log in.
- The shop domain, to create the banner configuration.
- Banner settings you save in the module.
- From the storefront: visitors' consent decisions and anonymous pageview counts, used for the consent log and plan limits.

Links from the module to CookiePilot and sign-ups made in the module carry `utm_source=prestashop-module` and `utm_medium=plugin`. They contain no shop or personal identifiers.

Uninstalling

Uninstalling the module removes the banner and the locally stored credentials. Your CookiePilot account, the consent log and the remote configuration are kept, so you can reconnect later.

Support

If you installed the module from PrestaShop Addons, contact us through the module page on Addons (*Contact the developer*). If you downloaded it from the CookiePilot dashboard, write to support@cookiepilot.io.
